Paybook Gateway, Easy Process, System Integrated

In the ONEIDNET System, we have incorporated and integrated a Payment Gateway called Paybook. Paybook has multiple functions for users to make their ONEIDNET transactions with ease and faster. Incorporation of ONEIDNET into the System saves all its users time, money and effort as the Paybook functions automatically within the System.

When users first sign up to the ONEIDNET Internet Operating System, after completing their NetPro User Profile, users then go to complete their Paybook Profile. The user's Paybook Profile includes the user's Dashboard, Mycards, Pending Transactions and Transaction History. The user's pay information must be completed and saved in order for the Paybook Gateway to become automatic for the user.

In the System Control Panel, users can go to the top right hand corner of the screen, where all the ONEIDNET related links are and select the Paybook link. The Paybook screen comes up with the information to be completed by users. Once the Paybook Gateway comes up, the user starts with the Dashboard page, this page displays the user's data regarding payments. The user then clicks on the Mycards tab to add their cards' information.

After a user completes his/her Paybook Profile and the user commences their transaction activities in ONEIDNET, the user then gets their Paybook data displayed in the Dashboard page. The user's Dashboard includes information data for the user's Personal Expense Account, Government Account, Offshore Account, Business Account, National Account and International Account. Additionally, the user gets data on his/her Dashboard regarding Expenses and Failed Transactions with their recent activity.

The form to be completed by users to enter their accounts' information is simple and easy to save. Once the user saves his/her account information, the new added card is displayed in the user's Dashboard and in Mycards, showing Card Name, Number, Card Use, Card Type, Geographical Coverage and Card Actions.

The Pending Transactions tab of the Paybook Gateway shows the user's information

regarding transactions the user is engaging on with the System. The transactions show Type of transaction, Name of the transaction and Amount of the transaction.

The user's Transaction History in the Paybook Gateway also displays information on the user's transaction Type, Name and Amount. So the user gets relevant information regarding his/her accounts to stay up to date with status and activities.

The Paybook Gateway is integrated with every System Module where transactions may be done by users. It is interfaced with the Modules following the user's registration process in OneNetwork for any Module Services agreements. After the successful completion of user registration in any of the Modules through OneNetwork, the user is automatically redirected to Paybook to complete the user's transactions.
